

Statistics

- According to Wallstone USA and Onix Cleaning Services, 30-45 minutes is recommended to deep clean.
- Approximately 4-6 hours were set aside per month to thoroughly clean countertops
- Countertops can become bacterial breeding grounds — a single bacterial organism can populate into 8 million in less than 24 hours
- There are around 488 bacterial colonies/sq inch on a kitchen countertop

The Problem

Dirty countertops are a common household occurrence for busy households, causing mental stress, unhygienic food preparation surfaces, and time inefficiency.

Clean surfaces were linked to a decrease in anxiety of about 27%. *S. Aureus* — a bacteria which could lead to pneumonia and bloodstream infections — was found on countertops and refrigerator door handles in 39% of households

Proposed Solution

The solution would be a tool or device that would ease the process of cleaning countertops, meeting requirements of time efficiency; bacterial disinfecting; and little to no mental stress.
